# How to model a database?

## Relational model

- ▶ introduced by E. Codd in 1969
- ▶ using structure and language consistent with first-order logic
- ▶ lays foundation to relational databases and SQL

## Declarative method

- ▶ high-level abstraction
- ▶ you express what you know (facts)
- ▶ you express what you want to find out (queries)
- ▶ the system takes care of implementation details

## Relational databases

Student

ID	Name	DoB	Phone
1	John Smith	16.04.1992	(716) 5143-2351
4	Mary Black	21.06.1990	NULL
3	Steve Cat	13.01.1991	(524) 386-9820
5	Amy Blight	NULL	(376) 915-2387

## Relational databases

Table name (relation name)

Column name (attribute name)

Student

ID	Name	DoB	Phone
1	John Smith	16.04.1992	(716) 5143-2351
4	Mary Black	21.06.1990	NULL
3	Steve Cat	13.01.1991	(524) 386-9820
5	Amy Blight	NULL	(376) 915-2387

Row (tuple) →

Cell (attribute value)

## Relational databases

Table name (relation name)

Column name (attribute name)

Row (tuple)

ID	Name	DoB	Phone
1	John Smith	16.04.1992	(716) 5143-2351
4	Mary Black	21.06.1990	NULL
3	Steve Cat	13.01.1991	(524) 386-9820
5	Amy Blight	NULL	(376) 915-2387

Cell (attribute value)

Special **NULL** value for unknown or non-existent data

# Relational databases

## Relation Schema

Student			
ID	Name	DoB	Phone
1	John Smith	16.04.1992	(716) 5143-2351
4	Mary Black	21.06.1990	NULL
3	Steve Cat	13.01.1991	(524) 386-9820
5	Amy Blight	NULL	(376) 915-2387

## Relation Instance

## Relational databases

Student(ID, Name, DoB, Phone)

Relation Schema

Student			
ID	Name	DoB	Phone
1	John Smith	16.04.1992	(716) 5143-2351
4	Mary Black	21.06.1990	NULL
3	Steve Cat	13.01.1991	(524) 386-9820
5	Amy Blight	NULL	(376) 915-2387

Relation Instance

# Integrity Constraints

Constraints are restrictions on database instances

They restrict the values that can be used

- ▶ attribute/column types
- ▶ whether NULL values can be used
- ▶ whether values can repeat in a table (key)
- ▶ whether values have to be referenced from another table (foreign key)

## Functional dependencies

Functional dependency  $R : X \rightarrow Y$

- ▶  $R$  is a relation name,  $X$  and  $Y$  are sets of attributes of  $R$
- ▶ there **cannot** be two tuples that have the same values on  $X$  but different values on  $Y$

Student : Post Code  $\rightarrow$  City

Student

ID	Name	Post Code	City
1	John Smith	59000	Lille
4	Mary Black	59800	Lille
3	Steve Cat	59000	Lille
5	Amy Blight	62000	Arras

## Functional dependencies

Functional dependency  $R : X \rightarrow Y$

- ▶  $R$  is a relation name,  $X$  and  $Y$  are sets of attributes of  $R$
- ▶ there **cannot** be two tuples that have the same values on  $X$  but different values on  $Y$

Student : Post Code  $\rightarrow$  City

Student

ID	Name	Post Code	City
1	John Smith	59000	Lille
4	Mary Black	59800	Lille
3	Steve Cat	59000	Lille
5	Amy Blight	62000	Arras
6	Pam Anders	59000	Wazemmes

Two tuples with the same Post Code but different City

## Keys

Key is a specific type of functional dependency

- ▶ let  $R$  be a relation with attributes  $U$  and  $K \subseteq U$
- ▶  $K$  is a key of  $R$  if  $R : K \rightarrow U$
- ▶ a valid instance cannot have two tuples with the same value on  $K$

Student : ID  $\rightarrow$  ID Name DoB Phone

Student

<u>ID</u>	Name	DoB	Phone
1	John Smith	16.04.1992	(716) 5143-2351
4	Mary Black	21.06.1990	NULL
3	Steve Cat	13.01.1991	(524) 386-9820
5	Amy Blight	NULL	(376) 915-2387

Primary Key

- ▶ one selected key of a relation (all others are called secondary)
- ▶ underlined in the schema

## Inclusion dependencies

### Inclusion dependency $R[X] \subseteq P[Y]$

- ▶  $R$  and  $P$  are relation names,  $X$  is a set of attributes of  $R$ ,  $Y$  is a set of attributes of  $P$  ( $X$  and  $Y$  have the same number of elements)
- ▶ the values on  $X$  in any tuple of  $R$  must be used on  $Y$  in some tuple of  $P$

$$\text{Course}[\text{Prof\_ID}] \subseteq \text{Prof}[\text{ID}]$$

<u>Name</u>	Room	Prof_ID
AI	A2.416	2
BDD	B3.245	3
R	A1.425	3

<u>ID</u>	Name	Office
1	Marc	C.40
2	Fabien	C.41
3	Sławek	C.42

### Foreign key constraint

$R[X] \subseteq P[Y]$ , where  $Y$  is the primary key of  $P$

## Inclusion dependencies

### Inclusion dependency $R[X] \subseteq P[Y]$

- ▶  $R$  and  $P$  are relation names,  $X$  is a set of attributes of  $R$ ,  $Y$  is a set of attributes of  $P$  ( $X$  and  $Y$  have the same number of elements)
- ▶ the values on  $X$  in any tuple of  $R$  must be used on  $Y$  in some tuple of  $P$

$$\text{Course}[\text{Prof\_ID}] \subseteq \text{Prof}[\text{ID}]$$

<u>Name</u>	Room	Prof_ID
AI	A2.416	2
BDD	B3.245	3
R	A1.425	3
HTML	A1.425	13

<u>ID</u>	Name	Office
1	Marc	C.40
2	Fabien	C.41
3	Sławek	C.42

There is not professor with ID=13 in our database

### Foreign key constraint

$R[X] \subseteq P[Y]$ , where  $Y$  is the primary key of  $P$

## Constraints in SQL

```
CREATE TABLE VILLE (  
    NOM TEXT,  
    CP TEXT,  
    TEL_MAIRIE TEXT NOT NULL,  
  
    PRIMARY KEY (NOM,CP)  
);  
  
CREATE TABLE ETUDIANT (  
    ID INTEGER PRIMARY KEY AUTOINCREMENT,  
    NOM TEXT NOT NULL,  
    NSS TEXT UNIQUE,  
    SEXE TEXT CHECK(SEXE IN ('F','M')),  
    TEL_PORT TEXT,  
    TEL_FIXE TEXT,  
    M_POTE INT REFERENCES ETUDIANT(ID),  
    VILLE TEXT,  
    CP TEXT,  
  
    CHECK (TEL_PORT IS NOT NULL OR TEL_FIXE IS NOT NULL),  
    FOREIGN KEY (VILLE,CP) REFERENCES VILLE(NOM,CP)  
);
```
